Task-3 Short written Response :-

To prevent misuse or overuse of the API for 200 + employees, I would put two control in place.

First, I would restrict certain type of unsupported or risky inputs. For example, If a user sends a Youtube video link or another source that the system cannot directly access, the tool should return a clear message saying that the content cannot be accessed. This helps prevent misuse, avoide confusing output and keep the system with supported boundaries. This is similar to how chat-GPT sometimes responds when it cannot actually open or inspect a link. This prevents misleading Answers and keep user aware of the tool's limit.

Second, I would set a Token or usage limit for each user. in a company with a 200+ employees, a few people sending too many large requests can quickly increase cost and slow the tool down for everyone else. A simple daily or monthly limit keeps usage fair and sustainable.
